TigerZilla

SMART CONTRACT AUDIT REPORT

Prepared by:

BlockAudit

Date Of Enrollment:

December 26th, 2021 - January 04th, 2022

Visit : www.blockaudit.report

TABLE OF CONTENTS

SUMMARY

This Audit Report mainly focuses on the extensive security of **TIGERZILLA** Smart Contracts. With this report, we attempt to ensure the reliability and correctness of the smart contract by complete and rigorous assessment of the system's architecture and the smart contract codebase.

The auditing process pays special attention to the following considerations:

- Testing the smart contracts against both common and uncommon attack vectors.
- Assessing the codebase to ensure compliance with current best practices and industry standards.
- Ensuring contract logic meets the specifications and intentions of the client.
- Cross referencing contract structure and implementation against similar smart contracts producedby industry leaders.
- Thorough line-by-line manual review of the entire codebase by industry experts.

The security assessment resulted in findings that ranged from critical to informational. We recommend addressing these findings to ensure a high level of security standards and industry practices. We suggest recommendations that could better serve the project from the security perspective:

- Enhance general coding practices for better structures of source codes;
- Add enough unit tests to cover the possible use cases;
- Provide more comments per each function for readability, especially contracts that are verified inpublic;
- Provide more transparency on privileged activities once the protocol is live.

OVERVIEW

Project Summary

Project Name	TIGERZILLA
Logo	
Platform	BSC
Language	Solidity
Code Link	https://bscscan.com/address/0x5181b4BdBFcA172283112060B9fD734Cfbc2aA02

File Summary

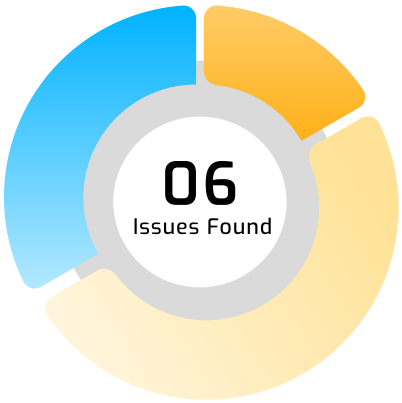
ID	File Name	Audit Status
TZL	TigerZilla.sol	Failed

Audit Summary

Date of Delivery	04 Jan 2022
Audit Methodology	Code Analysis. Automatic Assesment, Manual Review
Audit Result	Failed ✕
Audit Team	BlockAudit Report Team

FINDINGS

Critical	0	0.0%
High	0	0.0%
Medium	1	17.0%
Low	3	50.0%
Informational	2	33.0%
Ownership	0	0.0%
Gas Optimization	0	0.0%



Vulnerability Findings Summary

ID	Type	Line	Severity	Status
TZL01	Unchecked Low-Level Calls	767	Medium	Reported
TZL02	Missing zero address validation	613/617	Low	Reported
TZL03	Missing Events For Critical Parameters	T557/561/565/569/577/585/593/597/601/605/609/613/617/621/626/638	Low	Reported
TZL04	Receive() Should Add A Check For UniswapV2Router	T557/561/565/569/577/585/593/597/601/605/609/613/617/621/626/638	Low	Reported
TZL05	Single Point Of Failure	658	Informational	Reported
TZL06	Informational : Use Scientific Notation (EG 1E18) Rather Than Exponentiation	440-443	Informational	Reported

TZL01

Type	Unchecked low-level calls
Severity	Medium
File	TigerZilla.sol
Line	767
Status	**Reported**

Description

Missing check for return value in addLiquidity when calling uniswapV2Router.addLiquidityETH. Function addLiquidityETH(address,uint,uint,uint address,uint) external payable returns (uint,uint,uint); return value not checked on the tigerZilla contract that could lead to miss asset return or errors.

Remediation

Ensure that the return value of a low-level call is checked or logged.

Snapshot

```
762     function addLiquidity(uint256 tokenAmount, uint256 ethAmount) private {
763         // approve token transfer to cover all possible scenarios
764         _approve(address(this), address(uniswapV2Router), tokenAmount);
765 
766         // add the liquidity
767         uniswapV2Router.addLiquidityETH{value: ethAmount}(
768             address(this),
769             tokenAmount,
770             0, // slippage is unavoidable
771             0, // slippage is unavoidable
772             owner(),
773             block.timestamp
774         );
775     }
```

TZL02

Type	Missing zero address validation
Severity	Low
File	TigerZilla.sol
Line	613/617
Status	**Reported**

Description

setMarketingWalletAddress(address) and setTeamWalletAddress(address) does not check if address in parameter is address(0) , could lead to loss of assets

Remediation

Check that the address is not zero.

Snapshot

```
613     function setMarketingWalletAddress(address newAddress) external onlyOwner() {
614         marketingWalletAddress = payable(newAddress);
615     }
616
617     function setTeamWalletAddress(address newAddress) external onlyOwner() {
618         teamWalletAddress = payable(newAddress);
619     }
620
```

TZL03

Type	Missing events for critical parameters
Severity	Low
File	TigerZilla.sol
Line	557/561/565/569/577/585/593/597/601/605/609/613/617/621/626/638
Status	**Reported**

Description

The Functions below does not emit an event so it is hard to keep track of those critical parameters.

Remediation

Emit an event for critical parameter changes.

Snapshot

```
603     }
604
605     function setWalletLimit(uint256 newLimit) external onlyOwner {
606         _walletMax  = newLimit;
607     }
608
609     function setNumTokensBeforeSwap(uint256 newLimit) external onlyOwner() {
610         minimumTokensBeforeSwap = newLimit;
611     }
612
613     function setMarketingWalletAddress(address newAddress) external onlyOwner() {
614         marketingWalletAddress = payable(newAddress);
615     }
616
617     function setTeamWalletAddress(address newAddress) external onlyOwner() {
618         teamWalletAddress = payable(newAddress);
619     }
620
621     function setSwapAndLiquifyEnabled(bool _enabled) public onlyOwner {
622         swapAndLiquifyEnabled = _enabled;
623         emit SwapAndLiquifyEnabledUpdated(_enabled);
624     }
```

TZL04

Type	Single point of failure
Severity	Low
File	TigerZilla.sol
Line	557/561/565/569/577/585/593/597/601/605/609/613/617/621/626/638
Status	**Reported**

Description

Single point of failure if owner is not behind a multisig and changes are not behind a timelock.

As we know from the owner there is no multisig or timelocks before any critical changes which imply a single point of failure that could lead to critical issues. Maybe think about implementing other role , timelocks or multisig for admin owner

Remediation

Ensure that owner has no too much rights or got some restrictions to modify critical parameters.

Snapshot

```
603     }
604
605     function setWalletLimit(uint256 newLimit) external onlyOwner {
606         _walletMax  = newLimit;
607     }
608
609     function setNumTokensBeforeSwap(uint256 newLimit) external onlyOwner() {
610         minimumTokensBeforeSwap = newLimit;
611     }
612
613     function setMarketingWalletAddress(address newAddress) external onlyOwner() {
614         marketingWalletAddress = payable(newAddress);
615     }
616
617     function setTeamWalletAddress(address newAddress) external onlyOwner() {
618         teamWalletAddress = payable(newAddress);
619     }
620
621     function setSwapAndLiquifyEnabled(bool _enabled) public onlyOwner {
622         swapAndLiquifyEnabled = _enabled;
623         emit SwapAndLiquifyEnabledUpdated(_enabled);
624     }
```

TZL05

Type	receive() should add a check for UniswapV2Router
Severity	Informational
File	TigerZilla.sol
Line	658
Status	**Reported**

Description

receive() should add a check for UniswapV2Router
If the receive() function is only implemented to receive ETH from uniswapV2Router, better coding would be to implement a require(msg.sender = uniswapV2RouterAddress);

Remediation

Add a require statement.

Snapshot

```
657     //to recieve ETH from uniswapV2Router when swaping
658     receive() external payable {}
659
```

TZL06

Type	Use scientific Notation (EG 1E18) rather than exponentiation
Severity	Informational
File	TigerZilla.sol
Line	440-443
Status	**Reported**

Description

Use scientific Notation (EG 1E18) rather than exponentiation : better coding practice that do not require compiler optimization. Moreover , it can save gas.

Remediation

Ensure using good coding practice.

Snapshot

```
440     uint256 private _totalSupply = 10000000000000 * 10**6* 10**6 * 10**_decimals;
441     uint256 public _maxTxAmount = 10000000000000 * 10**6 * 10**6* 10**_decimals;
442     uint256 public _walletMax = 10000000000000 * 10**6 * 10**6* 10**_decimals;
443     uint256 private minimumTokensBeforeSwap = 10000000000000 * 10**6* 10**_decimals;
```

APPENDIX

Auditing Approach and Methodologies applied

The Block Audit Report team has performed rigorous testing of the project including the analysis of the code design patterns where we reviewed the smart contract architecture to ensure it is structured along with the safe use of standard inherited contracts and libraries. Our team also conducted a formal line by line inspection of the Smart Contract i.e., a manual review, to find potential issues including but not limited to

- Race conditions
- Zero race conditions approval attacks
- Re-entrancy
- Transaction-ordering dependence
- Timestamp dependence
- Check-effects-interaction pattern (optimistic accounting)
- Decentralized denial-of-service attacks
- Secure ether transfer pattern
- Guard check pattern
- Fail-safe mode
- Gas-limits and infinite loops
- Call Stack depth

In the Unit testing Phase, we coded/conducted custom unit tests written against each function in the contract to verify the claimed functionality from our client. In Automated Testing, we tested the Smart Contract with our standard set of multifunctional tools to identify vulnerabilities and security flaws. The code was tested in collaboration of our multiple team members and this included but not limited to;

- Testing the functionality of the Smart Contract to determine proper logic has been followed throughout the whole process.
- Analyzing the complexity of the code in depth and in detail line-by-line manual review of the code.
- Deploying the code on testnet using multiple clients to run live tests.
- Analyzing failure preparations to check how the Smart Contract performs in case of any bugs and vulnerabilities.
- Checking whether all the libraries used in the code are on the latest version.
- Analyzing the security of the on-chain data.

Issue Categories:

Every issue in this report was assigned a severity level from the following:

Critical Severity Issues

Issues of Critical Severity leaves smart contracts vulnerable to major exploits and can lead to asset loss and data loss. These can have significant impact on the functionality/performance of the smart contract.
We recommend these issues must be fixed before proceeding to MainNet..

High Severity Issues

Issues of High Severity are not as easy to exploit but they might endanger the execution of the smart contract and potentially create crucial problems.
Fixing these issues is highly recommended before proceeding to MainNet.

Medium Severity Issues

Issues on this level are not a major cause of vulnerability to the smart contract, they cannot lead to data-manipulations or asset loss but may affect funtionality.
It is important to fix these issues before proceeding to MainNet.

Low Severity Issues

Issues at this level are very low in their impact on the overall functionality and execution of the smart contract. These are mostly code-level violations or improper formatting.
These issues can be remain unfixed or can be fixed at a later date if the code is redeployed or forked.

Informational Findings

These are finding that our team comes accross when manually reviewing a smart contract which are important to know for the owners as well as users of a contract.
These issues must be acknowledged by the owners before we publish our report.

Ownership Privileges

Owner of a smart contract can include certain rights and Privileges while deploying a smart contract that might be hidden deep inside the codebase and may make the project vulnerable to rug-pulls or other types of scams.
We at BlockAudit believe in transparency and hence we showcase Ownership Privileges separately so the owner as well as the investors can get a better understanding about the project.

Gas Optimization

Solidity gas optimization is the process of lowering the cost of operating your Solidity smart code. The term "gas" refers to the level of processing power required to perform specific tasks on the Ethereum network.
Each Ethereum transaction costs a fee since it requires the use of computer resources. It will deduct a fee anytime any function in the smart contract is invoked by the contract's owner or users.

DISCLAIMER

This is a limited report on our findings based on our analysis, in accordance with good industry practice as at the date of this report, in relation to cybersecurity vulnerabilities and issues in the framework and algorithms based on smart contracts, the details of which are set out in this report. In order to get a full view of our analysis, it is crucial for the client to read the full report. While we have done our best in conducting our analysis and producing this report, it is important to note that the client should not rely on this report and cannot claim against us on the basis of what it says or doesn't say, or how we produced it, and it is important for the client to conduct the client's own independent investigations before making any decisions. We go into more detail on this in the below disclaimer below – please make sure to read it in full.

By reading this report or any part of it, the client agrees to the terms of this disclaimer. If the client does not agree to the terms, then please immediately cease reading this report, and delete and destroy any/all copies of this report downloaded and/or printed by the client. This report is provided for information purposes only and stays on a non-reliance basis, and does not constitute investment advice. No one/ NONE shall have any rights to rely on the report or its contents, and BlockAudit and its affiliates (including holding companies, shareholders, subsidiaries, employees, directors, officers and other representatives).

(BlockAudit) owes no duty of care towards the client or any other person, nor does BlockAudit claim any warranty or representation to any person on the accuracy or completeness of the report. The report is provided "as is", without any conditions, warranties or other terms of any kind except as set out in this disclaimer, and BlockAudit hereby excludes all representations, warranties, conditions and other terms (including, without limitation, the warranties implied by law of satisfactory quality, fitness for purpose and the use of reasonable care and skill) which, but for this clause, might have effects in relation to the report.

Except and only to the extent that it is prohibited by law, BlockAudit hereby excludes all liability and responsibility, and neither the client nor any other person shall have any claim against BlockAudit, for any amount or kind of loss or damage that may result to the client or any other person (including without limitation, any direct, indirect, special, punitive, consequential or pure economic loss or damages, or any loss of income, profits, goodwill, data, contracts, use of money, or business interruption, and whether in delict, tort (including without limitation negligence), contract, breach of statutory duty, misrepresentation (whether innocent or negligent) or otherwise under any claim of any nature whatsoever in any jurisdiction) in any way arising from or connected with this report and the use, inability to use or the results of use of this report, and any reliance on this report.

The analysis of the security is purely based on the received smart contracts alone. No related/third-party smart contracts, applications or operations were reviewed for security. No product code has been reviewed.

Note: The statements made in this document should not be interpreted as investment or legal advice, nor should its authors be held accountable for decisions made based on them. Securing smart contracts is a multistep process. One audit cannot be considered enough. We recommend that the **TIGERZILLA** team put a bug bounty program in place to encourage further analysis of the smart contracts by other third parties

About BlockAudit

BlockAudit is an industry leading security organisation that helps web3 blockchain based projects with their security and correctness of their smart-contracts. With years of experience we have a dedicated team that is capable of performing audits in a wide variety of languages including HTML, PHP, JS, Node, React, Native, Solidity, Rust and other Web3 frameworks for DApps, DeFi, GameFi and Metaverse platforms.

With a mission to make web3 a safe and secure place BlockAudit is commited to provide it's partners with a budget and investor friendly security Audit Report that will increase the value of their projects significantly.
